CROSS OVER

The wireline cross over is a wireline tool string adapter designed to connect two tool string items with incompatible threads.

* Cross Overs are also available with quick-lock connections for faster rig-up and break-out.
* A related product, the Union Cross Over Adapter, performs the same transition function at the lubricator and surface-equipment level, connecting unions of different types (for example Bowen and Otis style) with a union box on one end and a union pin-and-collar on the other.
* Machined from high-strength alloy steel and pressure-tested to the same rating as the rest of the tool string, so it never becomes the weak link in the makeup.
* Available with a range of thread combinations to interface wireline, slickline and braided-line equipment from different manufacturers, simplifying mixed-fleet toolstring makeup on location.
